Operating System Design

Chapter 12

Goals

Main goals of general purpose operating systems:

- 1. Define abstractions.
- 2. Provide primitive operations.
- 3. Ensure isolation.
- 4. Manage the hardware.

Interface Design Guiding Principles

- 1. Simplicity
- 2. Completeness
- 3. Efficiency

Execution Paradigms

```
main()
                                               main()
     int ... ;
                                                    mess_t msg;
     init();
                                                    init();
     do_something();
                                                    while (get_message(&msg)) {
     read(...);
                                                          switch (msg.type) {
     do_something_else();
                                                               case 1: ...;
     write(...);
                                                                case 2: ...;
                                                                case 3: ...;
     keep_going();
     exit(0);
                                                           (b)
        (a)
```

Figure 12-1. (a) Algorithmic code. (b) Event-driven code.

System Structure Layered Systems

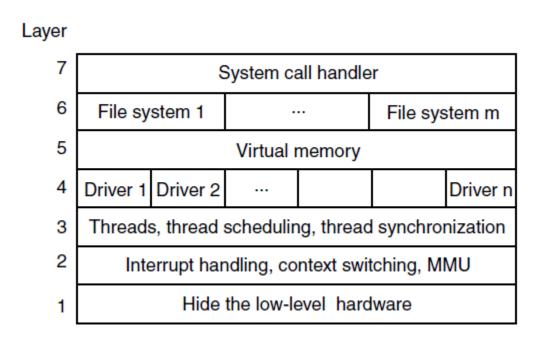

Figure 12-2. One possible design for a modern layered operating system.

Microkernel-Based Client-Server Systems

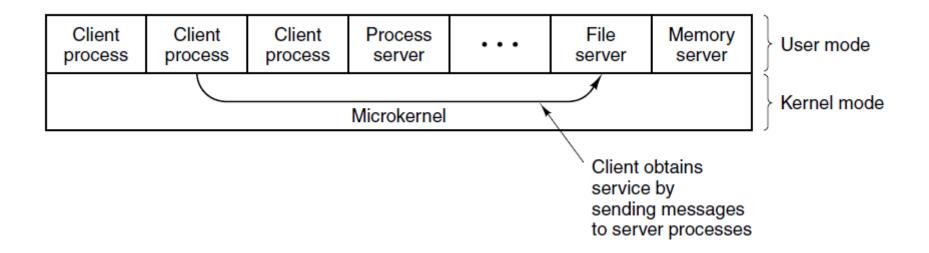

Figure 12-3. Client-server computing based on a microkernel.

Naming

External name: /usr/ast/books/mos2/Chap-12

Directory: /usr/ast/books/mos2

Chap-10 114
Chap-11 38
Chap-12 2

I-node table

7
6
5
4
3 Internal name: 2

Figure 12-4. Directories are used to map external names onto internal names.

Static vs. Dynamic Structures

```
found = 0;
for (p = &proc_table[0]; p < &proc_table[PROC_TABLE_SIZE]; p++) {
     if (p->proc_pid == pid) {
         found = 1;
         break;
     }
}
```

Figure 12-5. Code for searching the process table for a given PID.

Hiding the Hardware

```
#include "config.h"
                                                    #include "config.h"
                                                    #if (WORD_LENGTH == 32)
init()
                                                    typedef int Register;
#if (CPU == IA32)
                                                    #endif
/* IA32 initialization here. */
#endif
                                                    #if (WORD_LENGTH == 64)
                                                    typedef long Register;
                                                    #endif
#if (CPU == ULTRASPARC)
/* UltraSPARC initialization here. */
#endif
                                                    Register R0, R1, R2, R3;
           (a)
                                                            (b)
```

Figure 12-6. (a) CPU-dependent conditional compilation. (b) Word-length-dependent conditional compilation.

Space-Time Trade-offs (1)

Figure 12-7. (a) A procedure for counting bits in a byte.

Space-Time Trade-offs (2)

Figure 12-7. (b) A macro to count the bits. (c) A macro that counts bits by table lookup.

Space-Time Trade-offs (3)

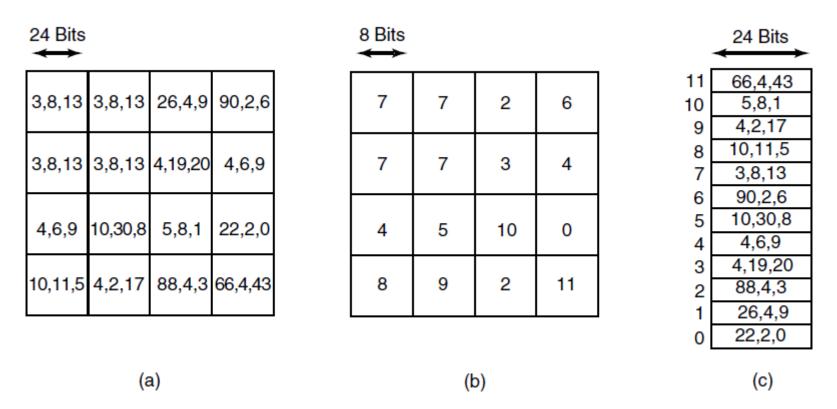

Figure 12-8. (a) Part of an uncompressed image with 24 bits per pixel. (b) The same part compressed with GIF, with 8 bits per pixel. (c) The color palette.

Caching (1)

To look up /usr/ast/mbox requires the following disk accesses:

- 1. Read the i-node for the root directory (i-node 1).
- 2. Read the root directory (block 1).
- 3. Read the i-node for /usr (i-node 6).
- 4. Read the /usr directory (block 132).
- 5. Read the i-node for /usr/ast (i-node 26).
- 6.Read the /usr/ast directory (block 406).

Caching (2)

Path	I-node number
/usr	6
/usr/ast	26
/usr/ast/mbox	60
/usr/ast/books	92
/usr/bal	45
/usr/bal/paper.ps	85

Figure 12-9. Part of the i-node cache for Fig. 4-34.

Project Management Team Structure

Title	Duties
Chief programmer	Performs the architectural design and writes the code
Copilot	Helps the chief programmer and serves as a sounding board
Administrator	Manages the people, budget, space, equipment, reporting, etc.
Editor	Edits the documentation, which must be written by the chief programmer
Secretaries	The administrator and editor each need a secretary
Program clerk	Maintains the code and documentation archives
Toolsmith	Provides any tools the chief programmer needs
Tester	Tests the chief programmer's code
Language lawyer	Part timer who can advise the chief programmer on the language

Figure 12-10. Mills' proposal for populating a 10-person chief programmer team.

The Role of Experience

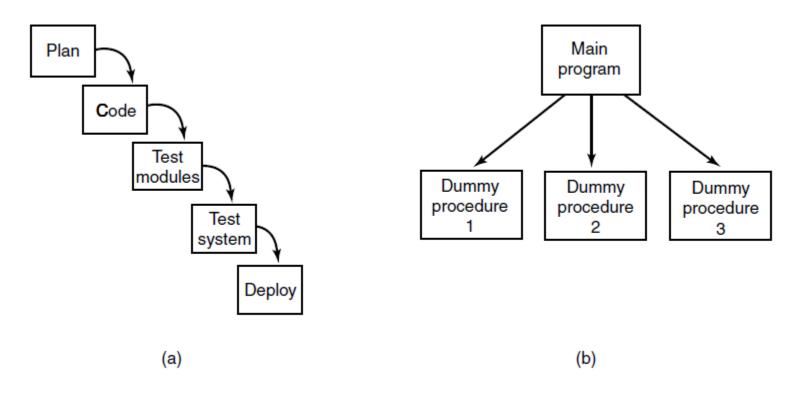

Figure 12-11. (a) Traditional software design progresses in stages. (b) Alternative design produces a working system (that does nothing) starting on day 1.

Trends In Operating System Design Virtualization and the Cloud

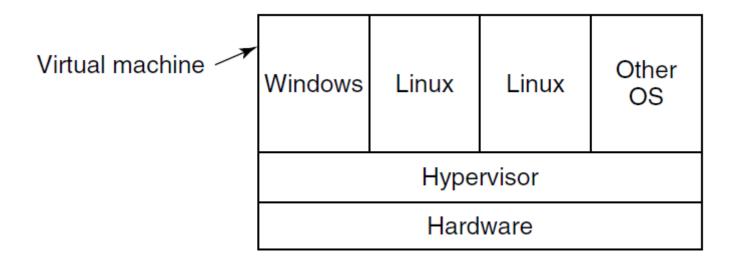

Figure 12-12. A hypervisor running four virtual machines.
